EDUCATION

Carleton University Ottawa, ON
Bachelor of Software Engineering | Graduated July 2026

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Java, Python, SQL, Go, C, Racket, HTML/CSS
Frameworks: React, Next.js, Angular, Node.js, NestJS, Express, Spring Boot, FastAPI
Data and infra: PostgreSQL, pgvector, Prisma, Redis, SQLite, Docker, Terraform, AWS, GitHub Actions
Tools and testing: Git, Arch Linux, OpenCode, JUnit, Testcontainers, pytest, Vitest, Playwright, Maven

PROJECTS

SupportLens | AI helpdesk with cited answers

Python, FastAPI, React, TypeScript, PostgreSQL, pgvector, Celery, Redis, Docker, Claude API

- An AI reply could quote help docs the agent isn't allowed to see, and a reply with no sources can't be checked.
- Built a helpdesk where an AI model (Claude by default, swappable) drafts ticket replies from a knowledge base and links each claim to its source.
- Built the permission check into the database search itself, so restricted text is never retrieved, rather than filtered afterward where one missed check could leak it.
- Made the right answer-or-refuse call on 28 of 35 questions in an offline eval, and deleting the permission filter breaks 10 of 12 retrieval tests.

FulfillOps | Order and inventory operations console

Java 21, Spring Boot, PostgreSQL, Angular, Testcontainers, Playwright, Terraform, AWS ECS

- Two reps can order the last units of a product at once, and a retried carrier request can ship a parcel twice.
- Built an order and inventory console with stock reservations, an order state machine and a stock ledger that a PostgreSQL trigger keeps append-only.
- Fixed the race condition with one conditional UPDATE backed by a CHECK constraint, and gave each carrier booking a unique request ID saved before the first try, so retries return the original booking.
- Restoring the old logic let both orders through in 48 of 50 concurrent runs; 176 backend tests run against real PostgreSQL in throwaway Docker containers.

Smart Scheduler | Carleton engineering capstone

TypeScript, React, Express, PostgreSQL, Prisma

- Carleton students plan terms by hand, cross-checking their audit, prerequisites and timetable for clashes.
- Built a planner that reads a student's degree audit, shows what's done and left, works out which courses they qualify for, and generates every conflict-free timetable around blocked-off times.
- Parsed prerequisite rules into AND/OR trees in PostgreSQL, including minimum grades and year standing, and fetched course details from Carleton's online calendar.
- Found timetables with a backtracking search that drops a partial timetable the moment it clashes; parsed prerequisites for 322 of 348 catalog courses, with 107 unit tests.

EXPERIENCE

Flyer Delivery and Trucking Assistant | Kanata Flyers (FlyerForce) Summers 2015–2026
Kanata, ON

- Delivered a Bridlewood flyer route under the area manager each summer, averaging close to 500 flyers.
- Loaded and trucked flyer bundles to carriers across Kanata.
- From 2022, gave up the route to run the area's trucking with the area manager every summer and during the school year as needed, alongside full-time studies.

Electronics Repair Technician | uBreakiFix (now Mobile Klinik) June 2020–September 2021
Kanata, ON

- Diagnosed and repaired hardware, software and connectivity faults in phones, laptops and other electronic devices.
- Tested each repaired device to confirm the original fault was fixed before returning it to the customer.
- Ordered replacement parts, managed parts inventory and processed warranty repairs under protection-plan rules.
